Amarinth delivers vertical in-line pumps to EDF for Sizewell B nuclear power station, United Kingdom

Amarinth, a world-leading, net zero designer and manufacturer of low lifecycle cost centrifugal pumps and associated equipment, primarily for the offshore and onshore oil & gas industries, nuclear and renewable energy generation, defence; desalination; process and industrial markets, has delivered two vertical in-line pumps to EDF to replace obsolete pumps at the Sizewell B nuclear power station, Suffolk, United Kingdom.

The Sizewell B nuclear power station on the Suffolk coast and operated by EDF is the only Pressurised Water Reactor in the United Kingdom. Last year Sizewell B generated low carbon electricity for 2.3 million homes. Following previous orders of pumps from EDF, Amarinth was once again selected to provide two vertical in-line pumps by EDF to replace end-of-life obsolete pumps at the power station.

Replacement of obsolete equipment in power stations to maintain operations has become a major issue for power generation companies and so Rolls-Royce has created the Proactive Obsolescence Management System (POMS) to quickly identify equipment suppliers that can provide replacement solutions for the obsolete equipment, particularly where the OEM has gone out of business. Amarinth is both registered in POMS and had previously undertaken a site survey of the existing pumps at Sizewell, giving EDF confidence that Amarinth fully understand the challenges of providing a replacement pump.

The power station requires filtered sea water during operation and the new Amarinth vertical in-line super duplex pumps delivered to EDF are to replace existing but now obsolete fibration screen spray pumps for the drum screen wash process.

The pumps are safe area rated, underwent a full suite of non-destructive evaluation (NDE), and carry A1 material certification for traceability. The pumps were also delivered to a tight 30-week deadline to coincide with a planned maintenance schedule thereby minimising disruption at the power station.

Oliver Briggins-Hawke, Managing Director of Amarinth, commented: “We are delighted that EDF has once again selected Amarinth for these new pumps which replace obsolete pumps where the OEM is no longer in business. Our obsolescence programme for OEM pumps, is designed for any organization facing issues with existing centrifugal pumps due to the OEM may have gone out of business. We can provide sacrificial and critical component spares; a strip service and refurbishment capability regardless of original equipment manufacturer; through it is a complete pump replacement, which in many cases is fully interchangeable, hydraulically and dimensionally, with the obsolete centrifugal pump, minimizing the need to mostly existing plant or pipework.”
