Amarinth, a world-leading, net-zero designer and manufacturer of low lifecycle cost centrifugal pumps and associated equipment, primarily for the offshore and onshore oil & gas industries; nuclear and renewable energy generation; defence; desalination; process and industrial markets, has supplied hydraulically and dimensionally interchangeable ISO 5199 centrifugal pumps to Babcock to replace obsolete end-of-life pumps during a refit of HMS Albion.

When the Royal Navy's HMS Albion came into Devonport for a refit, Babcock approached Amarith about four chilled sea-water recirculation pumps on the vessel that were installed over 25 years ago and which had reached their end-of-life.

The Girdlestone pumps were now obsolete with no replacement available from the original equipment manufacturer, potentially requiring expensive work to fit pipework and mountings to accommodate new pumps.

Obsolete pumps are an issue across many industries and Amarith has used its extensive knowledge and skills to design a range of ISO 5199 pumps that are both hydraulically and dimensionally interchangeable with Girdlestone pumps.

This ensures that old obsolete pumps can be replaced with new Amarith pumps that will perform the same, or better, than the original pumps, fit the existing footprint and require no expensive modification to pipework and fittings.

Babcock also requires its suppliers to meet stringent security requirements, which in this case... included the UK Government backed Cyber Essentials Certification, which during the refit of a Royal Navy vessel, complied with. This certifies that an organisation signing pumps for challenging marine duties and our ability to potential cyber-secure existing pumps on a like-for-like basis will ensure that HMS Albion will have reliable and fully supported pumps for a few more decades of operation. We look forwards to providing further pumps for Royal Navy vessels as and when they require similar replacements."
