Amarinth secures bespoke pump package order from Hyundai Heavy Industries

05 July 2016

Amarinth is to supply six high specification bespoke utility and fresh water pumps for the platform that Hyundai Heavy Industries (HHI) is building for ADMA-OPCO in the Nasr oil field, offshore Abu Dhabi.

The specification of the ISO pumps required the same level of diligence that would normally be expected for an API project.

The stainless steel utility and chilled water pumps are required to operate at higher temperatures and pressures than normal utility pumps and are designed with bespoke heavy duty baseplates to meet the vibration requirement stipulated by ADMA-OPCO. The order was completed with a full certification and documentation package.

Oliver Brigginsshaw, managing director of Amarith, said: "This was an unusual project being for ISO pumps but to a level of specification usually associated with API. We are delighted that HHI selected Amarith once again for a high-profile project and we are working closely with HHI to deliver pumps that will once again meet the exacting expectations of ADMA-OPCO."

Hyundai Heavy Industries selected Amarith following a tendering process.

Amarinth has previously delivered a number of pump packages to ADMA-OPCO in the Middle East and has also worked with Hyundai Heavy Industries, supplying pumps for BP's Quad 204 Floating Production Storage and Offloading vessel.

An Amarith ISO 5199 centre-line pump with heavy duty baseplate.
